Introduction

A Contact Manager is a software application designed to help users store, organize, and manage contact information efficiently.
In modern digital environments, individuals and organizations maintain a large number of contacts including friends, family,
customers, and colleagues. Managing these contacts manually can be difficult and time-consuming. A Contact Manager system
simplifies this task by storing all contact information in a structured digital format.

The Contact Manager project allows users to add, edit, delete, and search contacts quickly. Each contact typically contains
information such as name, phone number, email address, and sometimes address or notes. The system helps users maintain an
organized list of contacts and retrieve information whenever needed.

This project demonstrates the basic principles of software development such as system design, data management, and user
interaction. It also shows how applications can be designed to solve everyday problems effectively.

Objective

The main objective of the Contact Manager project is to develop a system that helps users manage contact details easily
and efficiently. The system focuses on providing a simple interface and reliable storage for contact information.

Objectives of the project include:

• To design a system for storing contact details such as name, phone number, and email.
• To provide functionality for adding new contacts.
• To allow users to edit or update existing contact information.
• To provide a feature for deleting unwanted contacts.
• To enable searching for contacts quickly.
• To organize contact information in a structured format.

Through this project, developers also gain practical experience in implementing application logic and managing user data.

System Requirements

Hardware Requirements:
• Computer or Laptop
• Minimum 4 GB RAM
• Minimum 500 MB free storage space

Software Requirements:
• Operating System: Windows / Linux / macOS
• Programming Language: Java / Python / Web Technologies (HTML, CSS, JavaScript)
• Development Tools: Visual Studio Code, Eclipse, or any IDE
• Database (optional): MySQL / SQLite

These requirements ensure that the Contact Manager system can run smoothly and efficiently without performance issues.

Methodology

The development of the Contact Manager project follows a structured methodology. The process begins with analyzing
the requirements of the system and identifying the key features needed for contact management.

Step 1: Requirement Analysis
In this step, the main functions of the system are identified, such as adding contacts, updating contacts,
deleting contacts, and searching contacts.

Step 2: System Design
The system architecture is designed. This includes designing the user interface, database structure,
and overall application workflow.

Step 3: Development
The actual coding of the application is done using the selected programming language and development tools.

Step 4: Testing
The system is tested to ensure all features work correctly. Errors and bugs are identified and fixed.

Step 5: Implementation
The final system is deployed so users can start managing their contacts using the application.

Implementation

The Contact Manager system is implemented by creating different modules that handle various tasks related to
contact management.

Add Contact Module:
This module allows users to enter new contact information such as name, phone number, and email address.
The data is then saved in the system database.

View Contact Module:
This module displays all saved contacts in an organized list so users can easily view their stored information.

Update Contact Module:
Users can modify existing contact information if any details change.

Delete Contact Module:
Users can remove contacts that are no longer required.

Search Contact Module:
This feature allows users to quickly find a specific contact by entering the name or phone number.

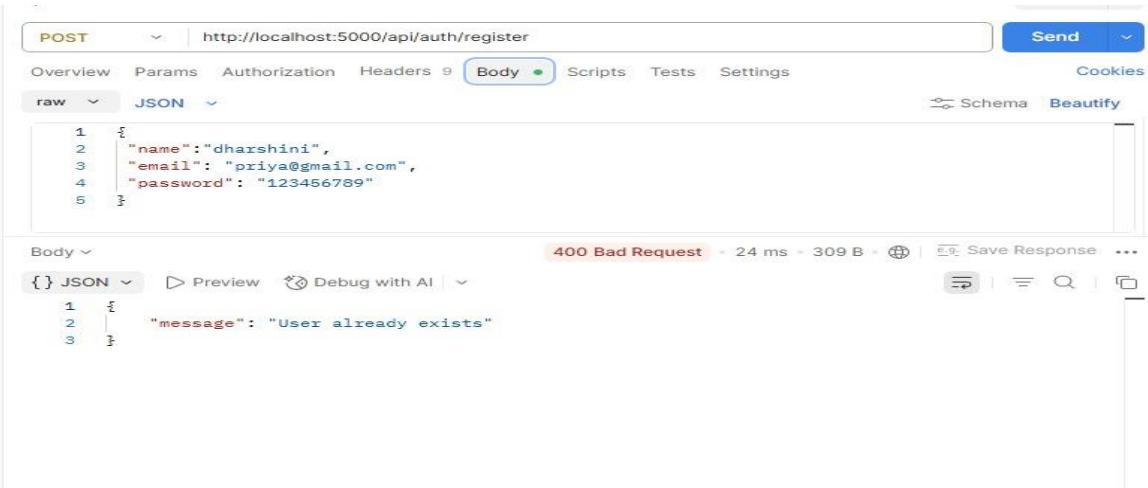
These modules work together to form a complete contact management system.

Output Screen

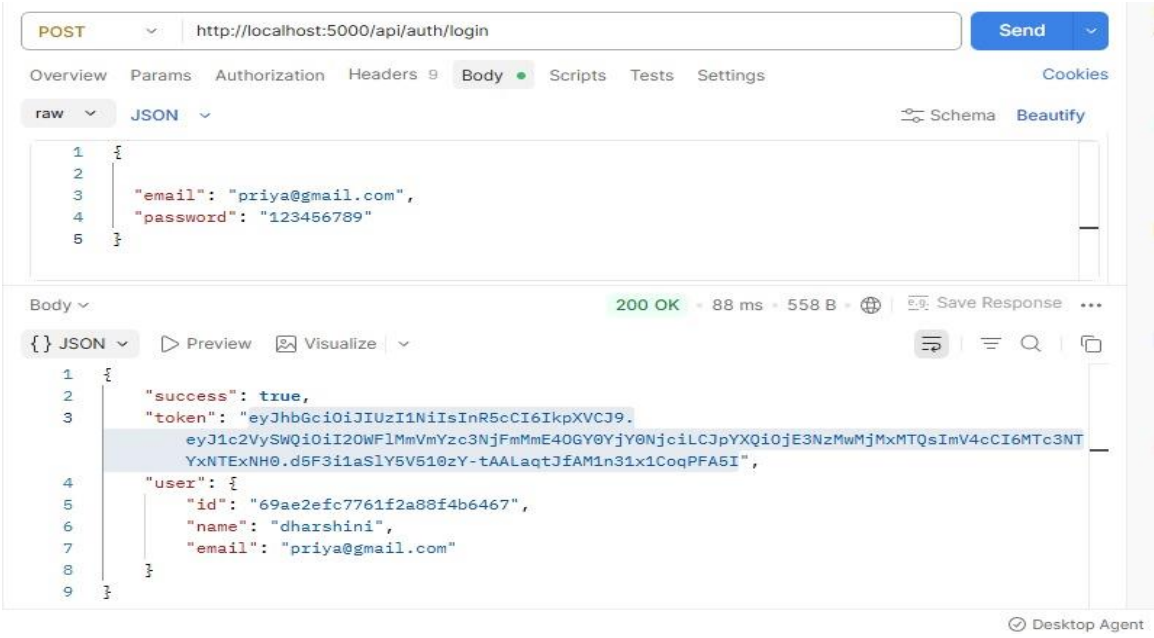
The output screens represent the user interface of the Contact Manager system. These screens show how users interact
with the application.

Typical output screens include:

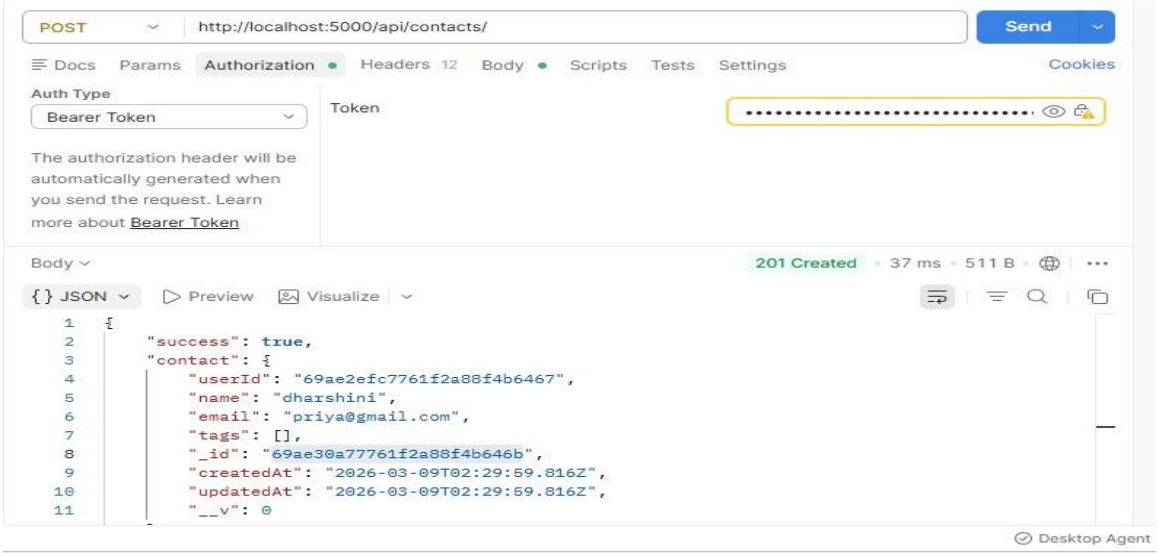
•Register API



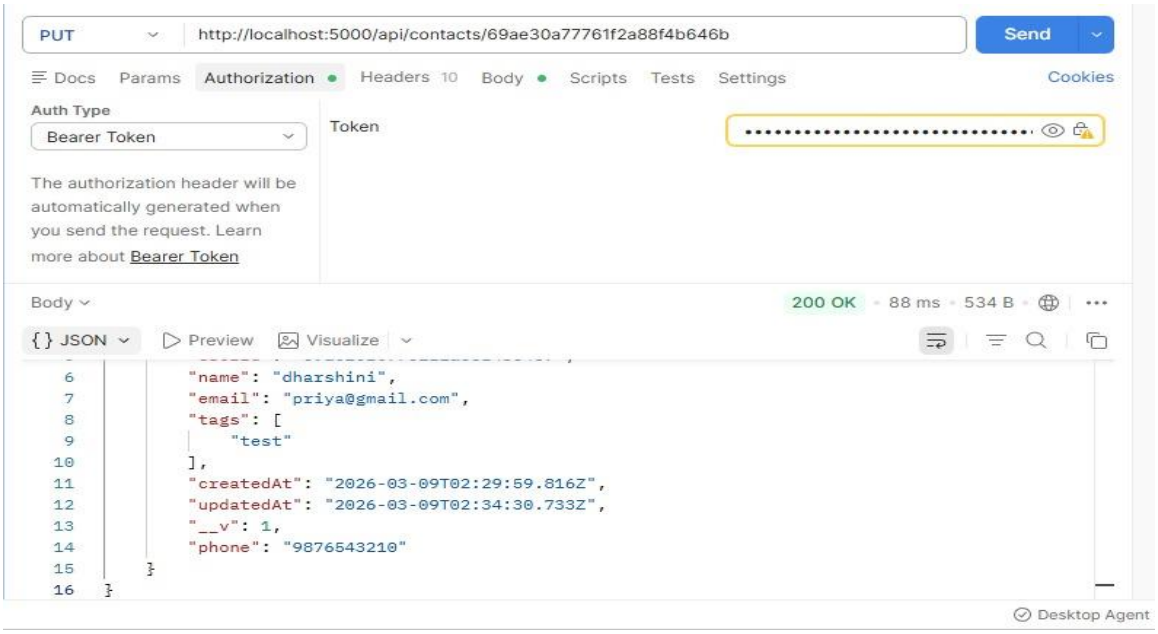
• Login API



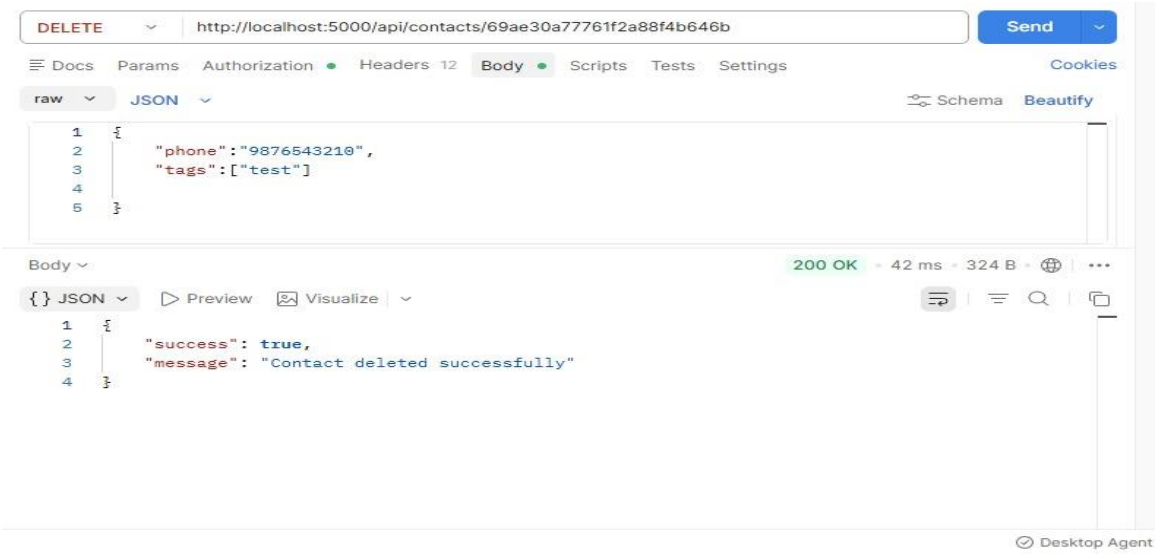
- **Create New Contact**



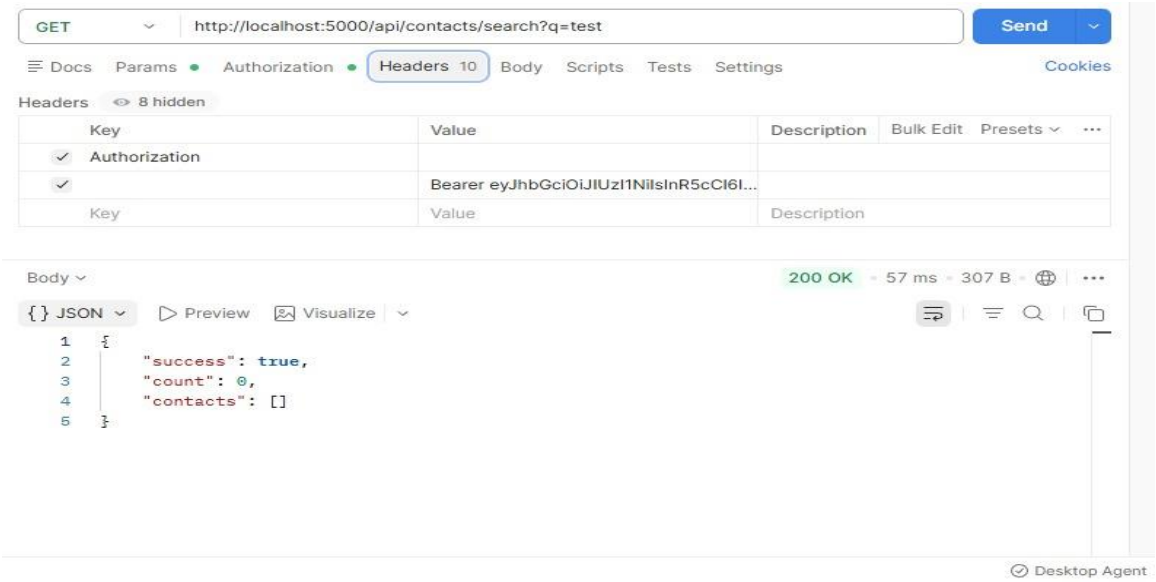
- **Update Contact**



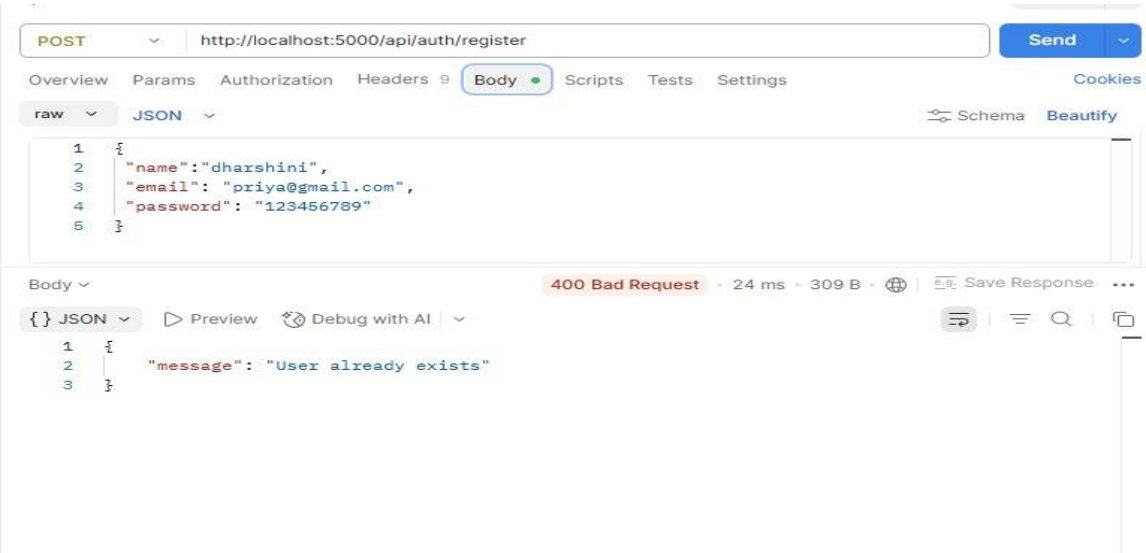
- **Delete Contact**



- **Search Contact**



- **Get the current user**



Conclusion

The Contact Manager project is a useful application that helps users store and organize contact information efficiently.
The system simplifies the process of managing contacts by providing features such as adding, editing, deleting, and
searching contact details.

Through this project, developers gain practical knowledge about system design, database management, and software
implementation. The project can also be enhanced in the future by adding additional features such as cloud storage,
data backup, mobile application support, and security authentication.

Overall, the Contact Manager system demonstrates how software applications can improve productivity and simplify
daily tasks.
